

Note concerning the establishment of the National Authority for Electricity Regulation

The new regulatory framework for the renewable energy sector, allows the opening of the electricity market generated from renewable energy to competition for customers connected in VHV / HV and MV.

Indeed, the law 13-09 on renewable energy offers the opportunity for private operators to develop projects for generating electricity from renewable sources and to sell the electricity produced with a guaranteed right of access to electrical networks VHV, HV and MV. It also offers the ability to export electricity from renewable sources and allows private companies to achieve, for their own use, direct transmission lines.

To follow these deep reforms and to increase the attractiveness of the renewable energy sector for private investors, it is necessary to strengthen this new regulatory framework by creating a National Authority for Electricity Regulation.

Under the new law 48-15, the National Authority for Electricity Regulation, will ensure the well-functioning of the free market for electricity generated from renewable sources and will regulate the access of self-producers to the national electricity transmission grid.

Indeed, the managers of TSO/Technical System Operator and medium voltage distribution will ensure no discrimination between the users of power grid.
